

EXECUTIVE FRAMEWORK

Enterprise Event-Driven Decoupling

Why distributed systems fail when services share database schemas, and how event-driven state boundaries restore resilience.

Swipe to Read →

STEP 01

01. Immutable Event Streams

Treat state changes as immutable domain events rather than shared table mutations. Downstream services maintain their own query-optimized projections.

SUMMARY & NEXT STEPS

02. Verification Over Trust

Every service boundary must be programmatically verified. Enforce contract schemas at build time to prevent cascading production outages.
